Covers all of the new names created by Pilsbry & his co-authors for both Recent & Fossil forms in the Mollusca & Crustacea. These names range in taxa from those above the family level to subspecies, varieties & forms. This work had its inception when the authors found it necessary to card out the new names which Pilsbry had instituted so that these names might be used in their own current

problems of research in the field of malacology. As time went on, this catalogue increased in size & became a source of information to the staff. Its publication has make available a large file of data not easily located elsewhere. He introduced 5,680 names over a period of 75 years; he introduced more names than any other student in the field of malacology.

Reproduction and Development in Mollusca

On the Mechanism of Aquatic Respiration and on the Structure of the Organs of Breathing in Invertebrate Animals

Philosophical Transactions of the Royal Society of London This book is perhaps the first attempt to comprehensively project the uniqueness of molluscs, covering almost all aspects of reproduction and development from aplacophorans to vampyromorphic cephalopods. Molluscs are unique for the presence of protective external shell, defensive inking, geographic distribution from the depth of 9,050 m to an altitude of 4,300 m, gamete diversity, the use of nurse eggs and embryos to accelerate the first few mitotic divisions in embryos, the natural occurrence of androgensics in a couple of bivalves, viable induced tetraploids, gigantism induced by elevated ploidy, the complementary role played by mitochondrial genome in sex determination by nuclear genes and the uptake and accumulation of steroid hormone from surrounding waters. In molluscs, sexuality comprises of gonochorism (24%), protandry (}
