The book focuses on stress in the context of education and health. The first part is concerned with stress in educational settings including stress, anxiety, and coping of preschoolers, primary school children, college students adolescents and teachers. The second part deals with stress and its effects on health, e.g. while coping with a distaster, with chronic pain or myocardial infarction.

As a researcher whose work focuses largely on the causes and conse quences of unwanted pregnancy, I may appear to be an unlikely candidate to write a foreword to a book on infertility. Yet, many of the themes that emerge in the study of unwanted pregnancy are also apparent in the study of infertility. Moreover, this volume is an important contribution to the literature on fertility, women's health issues, and health psychology in general, all topics with which I have been closely involved over the past two decades. Neither pregnancy nor its absence is inherently desirable: The occurrence of a pregnancy can be met with joy or despair, and its absence can be a cause of relief or anguish. Whether or not these states are wanted, the conscious and unconscious meanings attached to pregnancy and in fertility, the responses of others, the perceived implications of these states, and one's expectations for the future all are critical factors in determining an individual's response. In addition, both unwanted pregnancy and failure to conceive can be socially stigmatized, evoking both overt and subtle social disapproval. For ther, they involve not only the woman, but her partner, and potentially the extended family. Finally, both of these reproductive issues have been poorly researched. Because both are emotionally charged and socially stigmatized events, they are difficult to study. Much of the early literature relied on anecdotal or case reports.

**Human Diversity**

Addiction is a powerful and destructive condition impacting large portions of the population around the world, and because of ubiquitous technology, social networking and internet addiction have become a concern in recent years. With all ages affected by the fear of missing out, which forces them to stay continually connected in order to stay up-to-date on what others are doing, new research is needed to prevent and treat anxieties caused by internet use. Internet and TechnologyAddiction: Breakthroughs in Research and Practice is an authoritative resource for the latest research on the social and psychological implications of internet and social networking addiction, in addition to ways to manage and treat this unique form of addiction. Highlighting a range of pertinent topics such as digital addiction, social isolation, and technology servitude, this publication is an ideal reference source for psychologists, cyberpsychologists, cybersociologists, counselors, therapists, public administrators, academicians, and researchers interested in psychology and technology use.

**SPSS 12 Made Simple**

The 2nd World Congress on Genetics, Geriatrics and Neurodegenerative Disease Research (GeNeDis 2016), will focus on recent advances in geriatrics and neurodegeneration, ranging from basic science to clinical and pharmaceutical developments and will provide an international forum for the latest scientific discoveries, medical practices, and care initiatives. Advances information technologies will be discussed along with their implications for various research, implementation, and policy concerns. In addition, the conference will address European and global issues in the funding of long-term care and medico-social policies regarding elderly people. GeNeDis 2016 takes place in Sparta, Greece, 20-23 October, 2016. This volume focuses on the sessions that address geriatrics.
Determinants of Minority Mental Health and Wellness

This book collects the contribution of a selected number of clinical psychiatrists interested in the clinical evaluation of specific issues on psychopathy. The nine chapters of the book address some relevant issues related to nosography, early recognition and treatment, bio-psycho-social models (in particular cognitive-behavioral and ethological ones), and social and familial consequences of psychopathic personality.

Happiness

Can traumatic life events cause depression? Studies generally point to a connection between adverse life events and depression. However, establishing a causal rather than associative connection, the key concern of this book, is more problematic. What neurobiological changes may be induced by stress and depression, and to what extent do these changes correspond? The authors structure their examination around three major themes: the pathophysiological role of stress in depression; whether or not a subtype of depression exists that is particularly stress-inducible; and, finally, how best to diagnose and treat depression in relation to its biological underpinnings.

Social Support Measurement and Intervention

The goal of this book is to foster a basic understanding of factor analytic techniques so that readers can use them in their own research and critically evaluate their use by other researchers. Both the underlying theory and correct application are emphasized. The theory is presented through the mathematical basis of the most common factor analytic models and several methods used in factor analysis. On the application side, considerable attention is given to the extraction problem, the rotation problem, and the interpretation of factor analytic results. Hence, readers are given a background of understanding in the the theory underlying factor analysis and then taken through the steps in executing a proper analysis -- from the initial problem of design through choice of correlation coefficient, factor extraction, factor rotation, factor interpretation, and writing up results. This revised edition includes introductions to newer methods -- such as confirmatory factor analysis and structural equation modeling -- that have revolutionized factor analysis in recent years. To help remove some of the mystery underlying these newer, more complex methods, the introductory examples utilize EQS and LISREL.

Risk Factors in Depression

Modern Psychometrics

GeNeDis 2016

This study examined the structure of the Spanish version of the Multidimensional Scale of Perceived Social Support (MSPSS) among a sample of 122 undocumented Hispanic immigrants. The component structure of the scale was examined using principal components analysis (PCA). Contrary to the findings of the original three-subscale structure (Friends, Family, and Significant Other), the results yielded a two-subscale structure (Friends and Family/Significant Other), indicating a merging between two of the subscales. Internal consistency was examined and found the Spanish version of the MSPSS reliable. It appears that this version of the MSPSS is useful for undocumented Hispanic immigrants, given that the measure be used with two subscales as opposed to three.

Statistical Methods for Validation of Assessment Scale Data in Counseling and Related Fields

A vaccine is a biological preparation that improves immunity to a particular disease. According to the Oxford Dictionary, a vaccine is "an antigenic substance prepared from the causative agent of a disease or a synthetic substitute, used to provide immunity against one or several diseases". A vaccine tries to stimulates our immune system to recognize certain types of bacteria and viruses by injecting a weakened or killed pathogen, such as a bacterium or virus, or of a portion of the pathogen's structure to our body but is incapable of causing severe infection. Vaccines - Benefits and Risks is a reference book for the latest development and status of vaccine. It discusses vaccine effectiveness, toxicity and adverse effects. It takes a practical approach rather than a conceptual approach. It offers a truly reader-friendly way to get to this subject, making it the ideal resources for anyone who is new to this subject and providing a definitive guide to anyone in this vibrant and evolving discipline. Chapter 1 elaborates importance of reliability of different measures in medicine. It covers examples of the reliability analysis of instruments commonly used in clinical application. Chapter 2 proposes three methods to estimate the causal infectiousness effect under a number of identification assumptions, and provide a sensitivity analysis method to assess how inferences would change under violation of one of the identification assumptions. The presented methods can simply be conducted by applying an existing SAS code. Chapter 3 proposes using Dendritic cells signatures to test Vaccine Formulations where system Immunology approaches that combine transcriptomics and other analytical techniques will enable the identification of biomarkers of vaccine efficacy. Chapter 4 examines the limited effect of current pneumococcal vaccines in protection against mucosal disease. An experimental human pneumococcal carriage model is proposed as a potential tool for mucosal vaccine development. Chapter 5 reviews the latest information about bacterial OMVs (Outer Membrane Vesicles), which could be an alternative to develop safer and effective vaccines, and discusses findings on the nature of Brucella OMVs. Repeated exposure to Plasmodium falciparum malaria induces partial immunity,
characterised by low grade infection without associated illness, but during pregnancy there is a striking recurrence of severe
disease. Chapter 6 discusses the molecular interactions between parasite and placenta, the immune response that this
triggers, and considers the prospects for a vaccine mimicking naturally-acquired immunity to pregnancy-associated malaria.
Chapter 7 proposes a new tool consisting of a lentiviral vectors pseudotyped with the measles virus glycoproteins, H and F.
This new tool allows monitoring of measles virus escape from neutralizing antibodies induced by MV infection or vaccination
against measles. Chapter 8 summarizes the current knowledge about tumor immunology, mainly addressing the concept of
immunosurveillance and tumor antigens, in addition to the relevant aspects of dendritic cells and the strategies for
immunotherapy with these cells in lung cancer. Chapter 9 discusses how to identify biomarkers in tuberculosis. Tuberculosis
is an old disease which continues to be a major global health problem. Identifying biomarkers which would be translated into
a more accurate, inexpensive point-of-care tuberculosis tests that is applicable in indicating infection, disease, cure,
reactivation or protection is very crucial for diagnosis, prognosis and developing new vaccines that help in achieving global
tuberculosis control. Chapter 10 discusses BCG vaccine. BCG is currently the only available vaccine against tuberculosis. It
protects against the most severe forms of the disease, military and meningeal tuberculosis; however, it is highly variable in
its ability to protect against pulmonary tuberculosis.

The Meaning and Measurement of Social Support

An intriguing dialogue on how different groups of people in our society confront different social realities. Leading scholars
explore varied approaches to diversity in the research process and offer practical guidelines on conducting diversity-
conscious and diversity-sensitive projects and research.

Psychometric Properties of the Multidimensional Scale of Perceived Social Support

Measurement in Nursing and Health Research

New to This Edition *Extensively revised to cover important new topics: Pearl’s graphing theory and SCM, causal inference
frameworks, conditional process modeling, path models for longitudinal data, item response theory, and more. *Chapters on
best practices in all stages of SEM, measurement invariance in confirmatory factor analysis, and significance testing issues
and bootstrapping. *Expanded coverage of psychometrics. *Additional computer tools: online files for all detailed examples,
previously provided in EQS, LISREL, and Mplus, are now also given in Amos, Stata, and R (lavaan). *Reorganized to cover the
specification, identification, and analysis of observed variable models separately from latent variable models. Pedagogical
Features *Exercises with answers, plus end-of-chapter annotated lists of further reading. *Real examples of troublesome
data, demonstrating how to handle typical problems in analyses.

Validation of the Multidimensional Scale of Perceived Social Support (MSPSS) for Family
Carers of People with Dementia

Health Promotion in Nursing Practice presents a strong, up-to-date foundation for understanding and building the science
and practice of health promotion. The book has three goals: to introduce the major individual and community models and
theories that guide health promotion interventions; to offer evidence-based strategies for effective health promotion in
practice settings; and to foster critical thinking about future opportunities for research and more effective interventions. This
Sixth Edition is thoroughly updated to reflect the latest research and terminology. New coverage includes: the U.S.
Government’s Healthy People 2020 Goals; more ecological approaches encompassing families, communities, and nations;
new health promotion technologies, and more.

Data Analysis Using Stata, Third Edition is a comprehensive introduction to both statistical methods and Stata. Beginners will
learn the logic of data analysis and interpretation and easily become self-sufficient data analysts. Readers already familiar
with Stata will find it an enjoyable resource for picking up new tips and tricks. The book is written as a self-study tutorial and
organized around examples. It interactively introduces statistical techniques such as data exploration, description, and
regression techniques for continuous and binary dependent variables. Step by step, readers move through the entire process
of data analysis and in doing so learn the principles of Stata, data manipulation, graphical representation, and programs to
automate repetitive tasks. This third edition includes advanced topics, such as factor-variables notation, average marginal
effects, standard errors in complex survey, and multiple imputation in a way, that beginners of both data analysis and Stata
can understand. Using data from a longitudinal study of private households, the authors provide examples from the social
sciences that are relatable to researchers from all disciplines. The examples emphasize good statistical practice and
reproducible research. Readers are encouraged to download the companion package of datasets to replicate the examples
as they work through the book. Each chapter ends with exercises to consolidate acquired skills.

Cohort Studies in Health Sciences

Bringing together twenty-nine noted experts in various therapeutic and stress management fields, it details the history,
conditions for use, and key references for finding the measure and psychometrics of twenty-one different instruments used
in the evaluation of stress.

Successful Aging

This book will change the way we understand the future of our planet. It is both alarming and hopeful. James Gustave Speth,
renowned as a visionary environmentalist leader, warns that in spite of all the international negotiations and agreements of
the past two decades, efforts to protect Earth’s environment are not succeeding. Still, he says, the challenges are not
insurmountable. He offers comprehensive, viable new strategies for dealing with environmental threats around the world.

Page 3/7
The author explains why current approaches to critical global environmental problems - climate change, biodiversity loss, deterioration of marine environments, deforestation, water shortages, and others - don't work. He offers intriguing insights into why we have been able to address domestic environmental threats with some success while largely failing at the international level. Setting forth eight specific steps to a sustainable future, Speth convincingly argues that dramatically different government and citizen action are now urgent. If ever a book could be described as essential, this is it.

A Compendium of Psychosocial Measures

The information provided on both measurement and intervention will also be valuable to practitioners interested in designing and evaluating prevention and treatment initiatives.—BOOK JACKET.

Social Isolation and Loneliness in Older Adults

The field of health psychology has grown dramatically in the last decade, with exciting new developments in the study of how psychological and psychosocial processes contribute to risk for and disease sequelae for a variety of medical problems. In addition, the quality and effectiveness of many of our treatments, and health promotion and disease prevention efforts, have been significantly enhanced by the contributions of health psychologists (Taylor, 1995). Unfortunately, however, much of the theorizing in health psychology and the empirical research that derives from it continue to reflect the mainstream bias of psychology and medicine, both of which have a primary focus on white, heterosexual, middle-class American men. This bias pervades our thinking despite the demographic heterogeneity of American society (U. S. Bureau of the Census, 1992) and the substantial body of epidemiologic evidence that indicates significant group differences in health status, burden of morbidity and mortality, life expectancy, quality of life, and the risk and protective factors that con contribute to these differences in health outcomes (National Center for Health Statistics, 1994; Myers, Kagawa-Singer, Kumanyika, Lex, & M- kides, 1995). There is also substantial evidence that many of the health promotion and disease prevention efforts that have proven effective with more affluent, educated whites, on whom they were developed, may not yield comparable results when used with populations that differ by eth nicity, social class, gender, or sexual orientation (Cochran & Mays, 1991; Castro, Coe, Gutierrez, & Saenz, this volume; Chesney & Nealey, this volume).

Designated a Doody's Core Title! "This is a valuable resource for readers seeking basic to advanced information on measurement. It should be on the bookshelf of all researchers, and a requirement for graduate nursing students."—Score: 100, 5 stars—Doody's Medical Reviews "this book is a wonderful shelf reference for nurse researcher mentors and investigators who may need to explore content or use content to design, test, select, and evaluate instruments and methods used in measuring concepts and outcomes."—Clinical Nurse Specialist This fourth edition presents everything nurses and health researchers need to know about designing, testing, selecting, and evaluating instruments and methods for measuring in nursing. Thoroughly updated, this fourth edition now contains only the latest, most cutting-edge measurement instruments that have direct applicability for nurses and health researchers in a variety of roles, including students, clinicians, educators, researchers, administrators, and consultants. Using clear and accessible language, the authors explain in detail, and illustrate by example, how to conduct sound measurement practices that have been adequately tested for reliability and validity. This edition is enriched with topics on the leading edge of nursing and health care research, such as measurement in the digital world, biomedical instrumentation, new clinical data collection methods, and methods for measuring quality of care. Key features: Provides new and emerging strategies for testing the validity of specific measures Discusses computer-based testing: the use of Internet research and data collection Investigates methods for measuring physiological variables using biomedical instrumentation Includes information on measurement practices in clinical research, focusing on clinical data collection methods, such as clinimetrics Identifies the challenges of measuring quality of care and how to address them

Psychopathy

This book brings together state-of-the-art research on successful aging in Asian populations and highlights how the factors that contribute to successful aging differ from those in the West. It examines the differences between the Asian and Western contexts in which the aging process unfolds, including cultural values, lifestyles, physical environments and family structures. In addition, it examines the question of how to add quality to longer years of life. Specifically, it looks at ways to promote health, preserve cognition, maximize functioning with social support and maintain emotional well-being despite inevitable declines and losses. Compared to other parts of the world, Asia will age more quickly as a result of the rapid socioeconomic developments leading to rising longevity and historically low fertility rates in some countries. These demographic forces in vast populations such as China are expected to make Asia the main driver of global aging in the coming decades. As a result, researchers, professionals, policymakers, as well as the commercial sector, in both East and West, are increasingly interested in gaining a deeper understanding of aging in Asia.

Sociology of Marriage and the Family

"Dr. Dimitrov has constructed a masterpiece—a classic resource that should adorn the shelf of every counseling researcher and graduate student serious about the construction and validation of high quality research instruments. —Bradley T. Erford, PhD Loyola University Maryland Past President, American Counseling Association “This book offers a comprehensive treatment of the statistical models and methods needed to properly examine the psychometric properties of assessment scale data. It is certain to become a definitive reference for both novice and experienced researchers alike.” —George A. Marcoulides, PhD University of California, Riverside This instructive book presents statistical methods and procedures for the validation of assessment scale data used in counseling, psychology, education, and related fields. In Part I, measurement scales, reliability, and the unified construct-based model of validity are discussed, along with key steps in instrument development. Part II describes factor analyses in construct validation, including exploratory factor analysis, confirmatory factor analysis, and models of multitrait-multimethod data analysis. Traditional and Rasch-based analyses of binary and rating scales are examined in Part III. Dr. Dimitrov offers students, researchers, and clinicians step-by-step guidance on
contemporary methodological principles, statistical methods, and psychometric procedures that are useful in the development or validation of assessment scale data. Numerous examples, tables, and figures provided throughout the text illustrate the underlying principles of measurement in a clear and concise manner for practical application. *Requests for digital versions from ACA can be found on www.wiley.com. *To purchase print copies, please visit the ACA website here.

**Health Promotion in Nursing Practice**

Social isolation and loneliness are serious yet underappreciated public health risks that affect a significant portion of the older adult population. Approximately one-quarter of community-dwelling Americans aged 65 and older are considered to be socially isolated, and a significant proportion of adults in the United States report feeling lonely. People who are 50 years of age or older are more likely to experience many of the risk factors that can cause or exacerbate social isolation or loneliness, such as living alone, the loss of family or friends, chronic illness, and sensory impairments. Over a life course, social isolation and loneliness may be episodic or chronic, depending upon an individual's circumstances and perceptions. A substantial body of evidence demonstrates that social isolation presents a major risk for premature mortality, comparable to other risk factors such as high blood pressure, smoking, or obesity. As older adults are particularly high-volume and high-frequency users of the health care system, there is an opportunity for health care professionals to identify, prevent, and mitigate the adverse health impacts of social isolation and loneliness in older adults. Social Isolation and Loneliness in Older Adults summarizes the evidence base and explores how social isolation and loneliness affect health and quality of life in adults aged 50 and older, particularly among low income, underserved, and vulnerable populations. This report makes recommendations specifically for clinical settings of health care to identify those who suffer the resultant negative health impacts of social isolation and loneliness and target interventions to improve their social conditions. Social isolation and Loneliness in Older Adults considers clinical tools and methodologies, better education and training for the health care workforce, and dissemination and implementation that will be important for translating research into practice, especially as the evidence base for effective interventions continues to flourish.

**Transformational Reminiscence**

The work of 47 contributors from the U.S., Canada, and Israel, the Sourcebook gives special attention to the complexity of the social support construct, expanding the field's theoretical base by seriously reappraising social support research in the context of findings from other fields of psychology and related disciplines. Personality processes are specified to account for observed associations between social support and physical well-being. Several new studies are included which illustrate empirical approaches to exploring these processes. And key contributions highlight the great strides made in understanding the links among personal dispositions, situational contexts, and potentially supportive transactions.

**Internet and Technology Addiction: Breakthroughs in Research and Practice**

Chronic kidney disease is a non-communicable disease that has experienced a global surge in incidence and prevalence over the past few decades, and it has been increasingly considered a major contributor to the global disease burden and mortality. In prior years, most of the awareness and treatment of patients with chronic kidney disease, particularly in the developed world, had focused on patients with end stage renal disease, one of the potential outcomes of chronic kidney disease. More recent epidemiological data has shown that the majority of the burden of chronic kidney disease occurs in patients who are in the earlier stages of this condition, prior to end stage renal disease. The opportunities to recognise the signs, symptoms, and complications, and to consider extant treatment paradigms are useful in the global environment (both in developed and developing nations). We are very happy to present this work, authored by an international panel of experts, as a useful addition and tool for the global efforts to address the burden of chronic kidney disease.

**Stress, the Brain and Depression**

"[A]s recently as fifty years ago people believed that reminiscing was a sign of senility. Today, along with a greater understanding of the significance of reminiscence we have seen the rising popularity of private memoirs in various forms, from oral histories by universities to audio and videotapes for family archives. John A. Kunz and Florence Gray Soltys have made a major contribution to the field by providing a framework for individuals and groups engaged in this enriching and important work."

**Vaccines**

The United States is experiencing a dramatic shift in demographics, with minorities comprising a rapidly growing proportion of the population. It is anticipated that this will likely lead to substantial changes in previously established values, needs, and priorities of the population, including health and mental health for individuals, families, and society at large. This volume focuses on determinants of minority mental health and wellness. This emphasis necessarily raises the question of just who is a minority and how is minority to be defined. The term has been defined in any number of ways. Wirth (1945, p. 347) offered one of the earliest definitions of minority: We may define a minority as a group of people who, because of their physical or cultural characteristics, are singled out from the others in the society in which they live for differential and unequal treatment, and who therefore regard themselves as objects of collective discrimination. The existence of a minority in a society implies the existence of a corresponding dominant group enjoying higher social status and greater privileges.

The edition of this classic text has been completely revised and updated, taking into account recent developments in the field of psychometrics. Part 1 of Modern Psychometrics outlines the background, history and controversies surrounding psychological testing. Part 2 provides a practical guide for developing a psychometric test. SPSS 12 Made Simple provides a step-by-step coverage of every aspect of data analysis with SPSS from data entry to interpretation of the output. As well as advice on data entry and checking, there is guidance on the best ways of describing a data set and the choice of an appropriate statistical technique. Finally, the output is fully explained, with reference to fully annotated SPSS output. Extensive illustrations show exactly what is on the screen at every stage of the process, helping the reader to avoid common pitfalls and check their progress along the way. Most chapters end with practical exercises to illustrate the main points raised and allow the reader to test their understanding; but there is a final general revision section with further exercises on a range of topics. In view of the recommendations of the American Psychological Association, the book now contains advice on strength of effect, power and sample size. There is also guidance on how to report the results of statistical tests in journal articles. This new edition is written with the same clarity that has made the book such a success in the past. The initial chapters provide an introduction to the basics of SPSS, such as data entry, followed by more advanced techniques, such as sorting, case selection, aggregation and file merging. In these early chapters, the emphasis is upon checking the accuracy of data entry and exploring the data thoroughly before making any formal statistical tests. There is also extensive coverage of the powerful new graphics capabilities of SPSS 12. Each of the later chapters is devoted to a particular statistical technique. SPSS 12 Made Simple: *Covers a wide range of statistical tests including t-tests, ANOVA, correlation, regression, multi-way frequency analysis, discriminant analysis, logistic regression and factor analysis. *Shows you how to get as much out of your data as possible. *Gives advice (with appropriate cautions and caveats) on choosing a statistical test. *Makes extensive use of annotated screen snapshots of SPSS output, windows and dialog boxes. *Includes both chapter-specific and general exercises. *Has a comprehensive index.

A First Course in Factor Analysis

Depression is one of the most common mental health disorders, affecting 14% of all people at some point in their lifetime. Women are twice as likely to become depressed as men, but beyond gender there are a variety of risk factors that influence the prevalence and likelihood of experiencing depression. Risk Factors in Depression consolidates research findings on risk factors into one source, for ease of reference for both researchers and clinicians in practice. The book divides risk factors into biological, cognitive, and social risk factors. This provides researchers with the opportunity to examine the interface among different theoretical perspectives and variables, and to look for the opportunity for more complex and explanatory models of depression. Allows reader to compare and contrast the relative states of development of different models and their databases Examines the predictive power of these models related to various phases of clinical depression, including onset, maintenance, and relapse Provides an examination of the therapeutic implications of comprehensive and integrative models of depression

Handbook of Diversity Issues in Health Psychology

The second Canadian edition of Health Psychology: Biopsychosocial Interactions integrates multidisciplinary research and theory to help students understand the complex connections between psychology and health. This comprehensive yet accessible textbook covers the biopsychosocial factors that impact human health and wellness, placing particular emphasis on the distinctive characteristics of the Canadian health care system, the issues and challenges unique to Canadian culture, and the most recent Canadian research in the field of health psychology. Clear, student-friendly chapters examine topics such as coping with stress and illness, lifestyles for enhancing health and preventing illness, managing pain and discomfort, getting medical treatment, and living with chronic illness. This fully revised second edition features the latest available data and research from across Canada and around the world. New and expanded chapters explore psychosocial factors in aging and dying, legalized marijuana use in Canada, the link between inflammation and depression, Canadian psychosocial models of pain, recent Medical Assistance in Dying (MAID) legislation, weight control, eating disorders, and exercise, and much more. Throughout the text, updated illustrative examples, cross-cultural references, and real-world cases reinforce key points and strengthen student comprehension, retention, and interest.

**Evaluating Stress**

"Dale Johnson brings a rare and unique assortment of skills to this enterprise. . . . he has personally been immersed in the world of severe mental illness for many years and adds a compendium of appropriate tools for the research community."

--Harriet P. Lefley, PhD University of Miami School of Medicine (From the Foreword) This book discusses the rationale for the selection of psychosocial measures used to assess adults with serious mental illnesses. The chapters examine the use and efficiency of various measurement tools that intend to evaluate diagnostic and functional specificity, life stressors, supportive resources, quality of life, and more. The text also analyzes external factors that are vital to clients' clinical progress and continuing community tenure, such as continuity of care, housing resources, and family measures. Key Features: Presents the purpose of each measurement tool, the description, psychometric properties, reliability, validity, and usage guidelines in template format Includes measurement tools for functional assessment, community living, social problem solving and coping, agency performance evaluation, and more Contains research on treatment adherence, consumer satisfaction with mental health services, and feelings of empowerment Evaluates the functioning and productivity of treatment and rehabilitation centers This is the ideal tool for clinicians, psychiatrists, rehabilitation professionals, and other mental health professionals working with the mentally ill in hospital or community health settings.
