Urinary Tract Infection in Children and Antimicrobial Resistance Pattern Biswajit Batabyal, 2019-01-30 Urinary tract infections UTIs are counted among the most common infections in children Most commonly members of Enterobacteriaceae particularly urinary pathogenic strains of Escherichia coli and Enterobacter aerogenes are the primary causative organisms of UTIs in different parts of the world In spite of the availability and use of the antimicrobial drugs UTIs caused by bacteria have been showing increasing trends Antibiotics are a mainstay in the treatment of bacterial infections though their use is a primary risk factor for the development of antibiotic resistance Antibiotic resistance is a growing problem in paediatric urology as demonstrated by increased urinary pathogen resistance The extensive and inappropriate use of antimicrobial agents has invariably resulted in the development of antibiotic resistance which in recent years has become a major problem worldwide

Urinary Tract Infections Calvin M. Kunin, 1997

Urinary Tract Infection Tomas Jarzembowski, Agnieszka Daca, Maria Alicja Dębska-Ślizień, 2018-06-27 Urinary tract infection UTI is a problem so common and so significant in routine clinical practice that accurate diagnostics are especially important In particular complicated UTI is associated with an increased rate of therapy failures as a result of possible biofilm formation on foreign elements and antibiotic resistance as well as the increased possibility of an infection recurrence These are the arguments for the constant search for novel diagnostic tools and techniques These and many other vital topics regarding UTI complications management and treatment in addition to antibiotic resistance and bacterial virulence traits allowing us to mitigate or avoid antibiotic action are presented in this book

Conservation of the Intracellular Bacterial Community Pathogenic Pathway in Urinary Tract Infection David Aaron Rosen,2010

Urinary tract infections UTIs affect 13 million women annually in the United States Uropathogenic Escherichia coli UPEC is the predominant etiologic agent of UTI however several other uropathogens including Klebsiella pneumoniae are also significant causative agents In a murine cystitis model UPEC utilize a multistep pathogenic pathway in which they invade and form intracellular bacterial communities IBCs within bladder facet cells Type 1 pili adhesive fimbriae are necessary for UPEC binding and invasion of urothelial cells and formation of IBCs UPEC ultimately disperse from the IBC many with filamentous morphology and proceed to infect other host urothelial cells This work evaluates the conservation of the IBC pathogenic pathway across both host and uropathogen To determine if the IBC pathway occurs in human UTI urine samples from women with acute uncomplicated cystitis and from asymptomatic women were blindly analyzed We found evidence of IBCs in 18% and filamentous bacteria in 41% of urines from women with UTI None of the urines from the asymptomatic comparative group or from Gram positive UTIs showed evidence of IBCs or filaments These findings suggest that the IBC pathogenic pathway characterized in the mice also occurs in humans Numerous non UPEC Gram negative uropathogens were found competent for IBC formation in the murine cystitis model The uropathogenesis of one of these IBC formers K pneumoniae was compared to UPEC K pneumoniae was able to colonize the murine bladder and form IBCs but to a lesser extent than UPEC early in infection Much of this disparity can be attributed to differences in expression and function of type 1 pili Specifically K pneumoniae encodes an extra fim operon gene fimK which inhibits expression of type 1 pili Additionally K pneumoniae has a defect in the mannose sensitive hemagglutination phenotype of type 1 pili specific to its FimH adhesin domain These differences in expression and function of K pneumoniae type 1 pili explain in part why K pneumoniae is a less prevalent etiologic agent of UTI than UPEC To further analyze host factors involved in UTI pathogenesis of K pneumoniae and other uropathogens we developed a streptozocin induced diabetic model of UTI Diabetic mice were found to be more susceptible to UTI especially by non UPEC uropathogens compared to healthy mice This work revealed that the IBC pathogenic pathway occurs in human UTI and is common to several uropathogens albeit to varying degrees of efficiency Further insight into this conserved pathway may lead to enhanced UTI treatments and prevention of recurrence

An Optical Biosensor Towards Urinary Tract Infection Diagnosis Paul Béland,2015 We explore a new laboratory technique in the field of urinalysis promising a combination of speed and selectivity in support of urinary tract infection diagnosis Laboratory experimentation demonstrates long range surface plasmon polaritons LRSPP waveguides as a useful biosensor to selectively detect gram negative bacteria or gram positive bacteria in human urine The biosensor can detect bacteria at concentration of 10⁵ CFU ml the internationally recommended threshold for diagnostic of urinary tract infection UTI Using a negative control solution at bacterial concentration 1000x higher than the targeted bacteria in urine with a weak concentration of constituents the power ratio between the negative control signals to the target bacteria signal is measured to be 5.4 Thus we report a conclusive demonstration of the LRSPP waveguide biosensor selectivity to the gram of bacteria in human urine In addition the biosensor may prove useful as an alternative urinalysis test method to determine the urine specific gravity to estimate proteinuria and to detect biofilm formation on surfaces

Screening of Bioactive Compounds from Marine Seaweeds Against Urinary Tract Infective Pathogens S. S. Maithili, 2022-12-19 UTIs are contagious infection affecting both the male and female population and can infect various parts of the urinary tract system UTS such as urethra ureter urinary bladder and kidneys mainly focused on the lower UTS like urethra and ureter Escherichia coli and Klebsiella sp are the main causative agents although other Gram positive bacteria and even fungi have also been isolated in numerous infected population Flores Mireles et al 2015 Some of the main predisposing factors include age gender UTI history diabetes and sexual activity Patients with diabetes and older population groups are more prone to UTIs and are more common in this type of population than in the younger age population group Goddard et al 2018 UTIs are divided into two types namely complicated and uncomplicated UTIs In uncomplicated cases of UTIs UTS function is mostly healthy In complicated UTIs UTS function is not healthy or systematically accurate Some group of people are at higher danger of contracting UTIs than the others Both women and girls are at higher risk of contracting UTIs as their urethras are shorter as well as closer to the rectum that makes it easier for pathogenic bacteria to invade the UTS

Screening for Methicillin-Resistant Staphylococcus Aureus (Mrsa) U. S. Department Human Services, Agency for and Quality, 2013-08

Methicillin resistant *Staphylococcus aureus* MRSA emerged as a clinically relevant human pathogen more than five decades ago. The virulent bacterium was first detected in hospitals and other health care facilities where vulnerable hosts frequent exposure to the selective pressure of intensive antimicrobial therapy and the necessity for invasive procedures created a favorable environment for dissemination. MRSA emerged as an important cause of healthcare associated infections particularly central line associated bloodstream infection ventilator associated pneumonia and surgical site infection SSI. Despite the adoption of infection control measures the incidence of MRSA infection at most U S hospitals steadily increased for many years but it is now decreasing. While the decrease in the incidence of MRSA infection may be due to efforts to screen for MRSA carriage it may also be due to secular trends such as efforts to improve patient safety and to confounders such as efforts to improve the appropriate use of antibiotics and to decrease healthcare associated infections in general including catheter associated bloodstream infection ventilator associated pneumonia and SSI. A number of analyses suggest that MRSA infections are associated with increased mortality and cost of care when compared with those due to strains that are susceptible to methicillin. Even the availability of newer pharmaceutical agents with specific activity against MRSA has not ameliorated the challenge of caring for patients with MRSA. The widespread use of these agents has been limited in part due to toxicity cost and uncertainty as to optimal indications. The management and control of MRSA have been further complicated by dramatic changes in the epidemiology of transmission and infection observed over the past two decades. Specifically *S aureus* strains resistant to methicillin once exclusively linked to hospital care have increasingly been detected among patients in the community who lack conventional risk factors for MRSA infection. Community acquired MRSA has been linked to outbreaks of infection in hospitals and health care facilities. Conventional strategies for the control of MRSA have focused on the prevention of spread from patient to patient. The effectiveness of hand hygiene in preventing the spread of MRSA has been demonstrated in observational studies in which hand hygiene promotion campaigns were associated with subsequent reductions in the incidence of MRSA among hospitalized patients. While hand hygiene remains important in the effort to control MRSA transmission the continued spread of the pathogen after its initial introduction in most facilities has prompted efforts to identify additional strategies. The use of contact isolation including the donning of gowns and gloves when interacting with patients colonized or infected with MRSA and the assignment of such patients to single rooms or to a room with a group of affected patients has been widely promoted and adopted. Such isolation precautions now are the centerpiece of most authoritative guidelines for MRSA control. Despite the broad consensus associated with the use of contact isolation for MRSA prevention the specific evidence in support of this practice remains limited and indirect. The objective of this review was to synthesize comparative studies that examined the benefits or harms of screening for MRSA carriage in the inpatient or outpatient settings. The review examined MRSA screening strategies applied to all hospitalized or ambulatory patients as well as screening strategies applied to selected inpatient or outpatient populations and compared them with no screening or with screening of selected patient populations. The review evaluated MRSA screening strategies that included screening with or without isolation and with or without attempted eradication decolonization.

Microbiology of Urinary Tract Infections Payam Behzadi, Biljana Carevic, 2019-02-13 Generally in accordance with anatomical characteristics urinary tract infections UTIs and in particular recurrent UTIs occur in women in contrast UTIs normally occur in men with different predisposing factors There are several types of UTIs including asymptomatic and symptomatic complicated and uncomplicated acute and chronic with a diversity of microbial pathogens In pathogens virulence factors and genes determine the type and severity of the UTIs Obviously UTIs are a huge problem in global public healthcare systems with a wide range of predisposing factors including gender microbial agent the host s immune deficiencies genetic diseases catheterization etc The recent items determine the microbiology of UTIs Accurate diagnosis and definitive treatment are the key to UTI reduction
