## Dilution Of Precision

*Dilution of Precision Computation Procedure When Measuring Receiver Position in Geodetic Coordinates*, 1984 Certain users of the Global Positioning System GPS use the geodetic coordinate system to define their receiver position Satellite positions computed from either ephemeris or almanac data are best stated however in terms of Earth centered Earth fixed ECEF cartesian coordinates This presents a problem when computing values for a dilution of precision DOP in position the measure by which the four satellites most suitable for range measurements are determined Before receiving transmissions from GPS satellites and using them to determine precise receiver position the user must determine which four satellites are in the configuration that will maximize system accuracy This is accomplished by computing a DOP value for all groups for four satellites that are in view For GPS users who measure their receiver position in geodetic coordinates this value should reflect the use of these coordinates rather than ECEF cartesian coordinates This report outlines five algorithms all used in the process of computing a DOP in position The method to compute satellite position is described assuming the user is using almanac data and the dilution of precision in position term is defined in terms of geodetic coordinates The expressions defined for DOP are for users at sea level measuring receiver position in Earth fixed geodetic coordinates Keywords Geometric dilution of precision GDOP

## **Improvements and Extensions of the Geometrical Dilution of Precision (GDOP) Concept for Selecting Navigation**

**Measurements** William L. Brogan, NEBRASKA UNIV LINCOLN DEPT OF ELECTRICAL ENGINEERING., 1981 The optimal measurement selection problem is studied for the Global Positioning Satellite system GPS The fundamentals of the Geometrical Dilution of Precision GDOP concept are briefly reviewed because GDOP is frequently used to rank the effectiveness of potential measurements It is shown that GDOP does not always select the best measurements in the sense of minimum mean square navigation error For this reason weighted least squares and minimum variance Kalman filter methods are used to derive several improved measurement ranking schemes Nonuniform measurement noise and a prior knowledge about the state are taken into account Any specified weighted combination of the component error variances can be minimized Eigenvalue eigenvector theory is used to derive useful bounds and to provide geometrical insight A purely algorithmic approach is also presented and applied to a number of representative GPS cases In addition to the static single time point selection problem the time sequential selection problem is considered It is shown that the choice giving the smallest instantaneous position error may not give the smallest time average position error because of the trade off existing with velocity errors A promising approach is formulated for the sensor substitution problem That is should be degraded jammed satellite channels be deleted from the measurements and if so when Which backup sensors should be used instead A suboptimal filtering approach using state vector partitioning is used to derive some preliminary answers to these questions

**Dilution of Precision (DOP) Calculation for Mission Planning Purposes** Ming Fatt Yuen,2009 The Joint Munitions Effectiveness Manuals JMEM were developed by the Joint Technical Coordinating Group for Munitions Effectiveness JTTCG ME to provide a set of data and methodologies that would permit a standardized comparison of weapon effectiveness across all service communities In recent years the JMEM are being integrated into a single software program that allows users to determine the effectiveness of weapon systems against a specified target irrespective of the weapon delivery mode As part of the upgrading effort this thesis aims to develop a program written in Visual C to automate the calculation of the Dilution of Precision DOP associated with the delivery accuracy of GPS guided weapon systems The DOP values generated by the program were compared with those generated by commercial DOP calculation software for validation Relationship between the Vertical DOP and Horizontal DOP as well as the effect of using outdated almanac information to calculate DOP values were studied It was found that the loss of one visible satellite could cause the DOP to increase by as much as 38%

**Reducing Geometric Dilution of Precision Using Ridge Regression Signal Processing** Robert J. Kelly,1986

*Geometric Formulas for Dilution of Precision Calculations* Paul Darrell Massatt,Karl Rudnick,Institute of Navigation,1990 Geometric formulas are presented for computing a variety of different dilutions of precision that can be used in determining the expected rms error given knowledge of the user range errors associated with each satellite and the receiver These formulas include both two and three dimensional error estimations with or without knowledge of clock offset and altitude Also geometric formulas are given for the cases where satellite user range errors are not assumed uniform A methodology is then provided for computing other dilution of precision formulas
